MOGSCAN

real-time · multi-person · explainable PSL

Ben Blair · Cyril Sokolov

AI Final Project — Startup / Product Track — Dec 2, 2026

People want to know where they stand, and why

7M+
Umax downloads, ~$500K / month (mid-2024)

Twitch
Omoggle went viral on xQc, Asmongold streams (2026)

$4–10
per *week* for selfie face-rating subscriptions

But every product we tested:

- turns your face into a **competition** (Omoggle's 1v1) or a few vague categories
- gives a **number without a reason** you can check
- **uploads your face** to a server
- has **never shown** that its score matches what real people think

MogScan: your face, scored live, with receipts

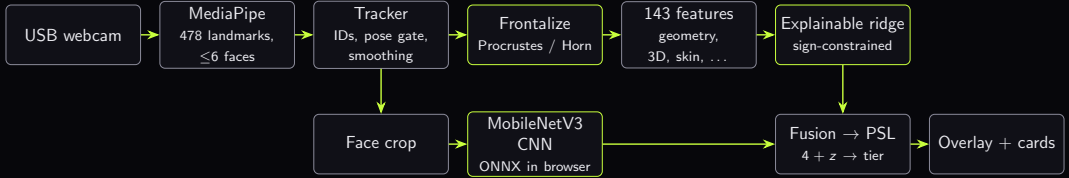

[Screenshot of one person
save as writeup/figures/hero.png]

- **Live camera** (any USB webcam) **or photo upload**
- **PSL 1–8** + tier (LTN . . . HTN, Chadlite, Chad)
- **Harmony, Dimorphism, Angularity, Softmax** sub-scores
- All **143 inputs** with their weights
- **Glow-up plan** with a predicted score
- No battles, no leaderboards
- 100% **on-device**

LIVE DEMO

live scan $\rightarrow$ turn your head $\rightarrow$ open all 143 weights $\rightarrow$ upload a photo

How it works

Frontalize
removes head turn: the symmetry metric was $r = 0.97$ with yaw before this

Sign-constrained ridge
explanations can't contradict the data (e.g. FWHR sign flip)

Trained on 5,500 faces
rated by 60 people (SCUT-FBP5500), and it runs in a browser tab

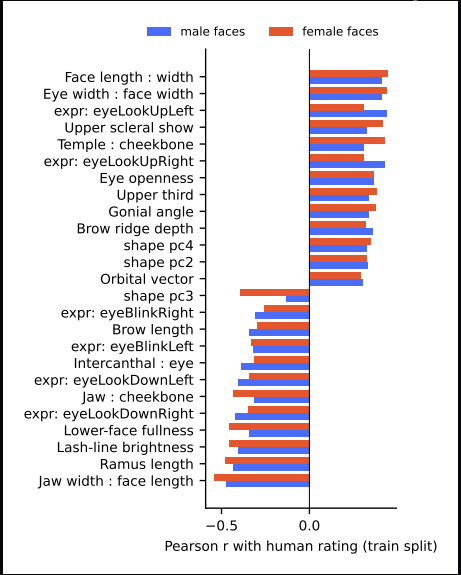

Does it agree with real people?

Model (official 60/40 split)	Pearson r
AlexNet (SCUT paper)	0.830
ResNet-18 (SCUT paper)	0.851
ResNeXt-50 (SCUT paper)	0.878
Ours: 15 classic ratios	0.675
Ours: all 143 features (explainable)	0.804
Ours: CNN	0.914
Ours: fused (live app)	**0.920**

- PSL error 0.29 points; tier within one step 98.1%
- Sex head 99.1% accurate (users can correct it)

Do looksmax rules hold up? Not all of them.

- **Canthal tilt**: $r \approx 0.00$ once head pose is removed. The earlier $+0.28$ came from pose
- **"Hunter eyes"**: more *open* eyes were rated higher
- **Wide jaw / high FWHR**: *narrower*, V-shaped lower faces were rated higher
- **Chin : philtrum** and eye spacing do match community advice

So MogScan shows the data-derived target *and* the community range.

Fairness check

Group	n	r	MAE	Signed bias
Asian female	792	0.922	0.212	-0.009
Asian male	811	0.930	0.179	-0.028
Caucasian female	285	0.906	0.232	+0.006
Caucasian male	312	0.886	0.220	-0.012

- Errors and bias are similar across the four groups in the data
- **But**: the dataset only has Asian and Caucasian faces, so other groups are **unvalidated**
- #1 priority before any commercial launch: diverse, licensed rating data

Traction: user study

[Run study/protocol.md, then make_figures.py. This slide fills in automatically.]

Competition

	Omoggle	UMAX/LooksMax	PSL apps	Qoves	**MogScan**
Live webcam	✓	–	–	–	✓
Competitive format	1v1 duels	–	–	–	none
Per-feature measurements	–	categories	categories	report	143 inputs + weights
Validated vs. humans	–	–	–	–	$r = 0.920$
On-device	claimed	–	–	–	✓
Price	free	\$4–10/wk	sub	\$20–200	free; \$4.99/mo

What we know that they don't: *explanations are the product*, and they only build trust if the measurements agree with real ratings and survive head movement.

Business model

Free web app

Live camera and photo scoring with full explanations. This is the acquisition channel and is easy to share as a link.

Pro — $4.99 / mo

History, progress tracking against your glow-up plan, side-profile scan. Cheaper than incumbents' *weekly* price.

Inference runs on the user's device, so marginal compute cost is close to $0.

Responsible by design

- 18+ and consent screen; only scan people who agree
- Nothing uploaded or stored; study logs are numbers only
- No battles, rankings or leaderboards; the score is framed as *one panel's judgement*, not your worth
- We measure wellbeing in the study ("felt worse about my looks")
- Known limits: two ethnic groups, binary sex labels, webcam domain shift, non-commercial dataset license

What's next

- Diverse, licensed rating dataset $\rightarrow$ retrain and publish subgroup error
- Side-profile scan: gonial angle, chin projection, E-line
- Progress tracking against the glow-up plan
- Grad-CAM heatmaps and a WebGPU backend
